

Install Anaconda

1. Download the Anaconda Graphical Installer from <https://www.anaconda.com/products/distribution>
2. Install Anaconda following the guide from <https://docs.anaconda.com/anaconda/install/>.

Use the default setting. Also, be sure to select the "Install for me only". For macOS, remember to click the "Change Install Location" button then click the "Install for me only" as shown in the following pictures.

Note

If you get the error message “You cannot install Anaconda in this location,” reselect Install for me only.

Register for GUROBI

License has to be activated at the campus

1. Go to the webpage <https://www.gurobi.com/downloads/end-user-license-agreement-academic/> and register an account.
2. After logging in, go to the User Portal --> Licenses --> Request and generate Named-User Academic

Home

Request License

Free License Options for Academic Users

WLS Academic

Run Gurobi Optimizer where you want, across or regular machines and container environments (Docker, Kubernetes...) with floating capability.

- Runs on machines and containers
- Requires Gurobi v10 or later
- Requires an internet connection during usage
- Valid for 90 days
- Can be extended as long as you maintain eligibility

GENERATE NOW!

Named-User Academic

Get a free, unlimited-use Gurobi Optimizer license for a single person, on a single machine.

- Runs on a single machine only
- Supports any Gurobi versions
- Requires an internet connection for installation
- Valid for one year
- New licenses can be generated as long as you maintain eligibility

GENERATE NOW!

Academic Cloud

Get on-demand access to Gurobi on cloud machines.

Although the license is free, you'll be responsible for the cost of cloud resource usage.

To get started, visit our Help Center and request an Academic Gurobi Cloud License.

SUBMIT REQUEST

- After creating new license, go to Licenses -> Install and save the command starts with "grbgetkey" for later use.

Install Packages

- Open "ANACONDA.NAVIGATOR"
 - WINDOWS:** From the Start menu, click the Anaconda Navigator desktop app.

- **MacOS:** Open Launchpad, then click the Anaconda-Navigator icon.

2. Create a new environment

- Click Environments -> Create, name the new environment "env_opt", with Python package 3.9

3. Open the terminal under “env_opt” environment

4. Install packages in the terminal window

- Type `conda install -c conda-forge jupyter` to install the Jupyter Notebook
- Type `conda install -c conda-forge cvxpy` to install the CVXPY.
- Type `conda config --add channels http://conda.anaconda.org/gurobi`

- Type `conda install gurobi` to install the GUROBI
- Retrieve the command you got from GUROBI(the command start with "grbgetkey") and paste it into the terminal window to install the GUROBI license

DO NOT use PIP unless you are familiar with Python and Anaconda

Open the Jupyter Notebook and start coding

1. Open the ANACONDA.NAVIGATOR, make sure the environment is "env_opt", then click Launch under the Jupyter Notebook

2. A new tab in your default browser will open, looks like the following screenshot

3. Navigate to the directory you want to save your file, click New -- Python 3 (ipykernel) and create a .ipynb file

4. Type your first code `print(hello world)` and click run, see the result
